Tyler Lukasiewicz

Abstract—This is an abstract and the words should be bold.
And if I write just a little bit more, it will make automatically.

I. APPROXIMATION OF THE DERIVATIVE

The derivative of a continuous function f is defined by the following equation.

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \quad (1)$$

So, if we would like to approximate the derivative of a continuous function f at a point x , then we may use the formula

$$f'(x) \approx f'_a(x) = \frac{f(x+h) - f(x)}{h} \quad (2)$$

For some h . As $h \rightarrow 0$, $f'_a(x) \rightarrow f'(x)$. We can determine the error of our approximation, ϵ with the formula

$$\epsilon = |f'(x) - f'_a(x)| \quad (3)$$

Below is a graph of the error, ϵ of the approximate derivative of $\sin(\pi/3)$.

Approximating the derivative using the limit definition

As we can see, as $h \rightarrow 0$, $\epsilon \rightarrow 0$.
